It is structurally related to the protein avidin. It can be readily conjugated to a range of other proteins. In order to facilitate the incorporated of streptavidin into expression vectors and the production of novel chimeric proteins containing streptavidin has functionality, an improved novel synthetic gene for streptavidin has been constructed (n90755) based on the amino acid sequence of mature

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a streptavidin which is used in a novel method of reducing interference from non-specific binding in assays. Mutchns constructed from a core streptavidin or avidin sequence are selected that differ from the native polypeptide by at least one amino acid and have a binding affinity for biotin of less than 1010 1/mole. The biotin-bindable polypeptide may be present as a polymeric conjugate, e.g. with another polypeptide or protein, especially bovine serum albumin. These muteins are used as anti-interference reagents for reducing and/or avoiding nonspecific interactions in a process for detecting an analyte. In particular, they are used in assays where the streptavidin/avidin-biotin specific binding pair is involved for qualitative and/or quantitative determination of an analyte in a test sample, e.g. a heterogeneous immunoassay or a hybridisation assay. Despite having a lower binding affinity for biotin, the mutein have high immunological cross-reactivity in the streptavidin and acid in the second of the content of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              W59216;

This sequence is used to produce mutants which are used in a method to assay the binding affinity of streptavidin mutants. These mutants have a mutation within the amino acid (aa) region 44-53 of the wild-type protein show a higher binding affinity than the wild-type for peptide ligands that include the sequence of formula Trp-X-His-pro-Gln-Phe-Y-Z where X = any aa; Y and Z are both Gly, or Y = Glu and Z = Arg or Lys. Recombinant streptavidin mutants can be used to isolate, purify and determine proteins or to determine/recover substances that contain streptavidin-binding groups. Such compounds may also be used to immobilise fusions on microtitre plates, microbeads or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cc protein (FCE). The fusion protein is a multidomain protein comprising:

Cc (a) a FCE; and (b) a first member of a binding pair, that is linked to

Ct the FCE chain: (i) directly by bonds utilizing the N-terminal amino

CC groups, the C-terminal carboxy groups or side-chain functionalities;

Cc (ii) via a bifunctional linkage moiety linking the groups or

CC functionalities; or (iii) by the first member binding to the second

CC member of the binding pair, where the second member of the binding pair

CC is covalently attached to the first polypeptide chain. The FCE can be

CC used in a method for producing fibrin. Fibrin is useful as a sealant in

CC surgery to, e.g. reduce bleeding by sealing blood vessels, and tissues

CC that have been dissected either in surgery or through wounding. The

CC fusion protein allows for the removal of the fibrinogen converting

CC enzyme from the fibrin sealant preparation via the binding of

CC streptavidin to a biotin solid support. The present sequence represents

CC Streptococcus streptavidin as given in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches 183;

Recombinant vector, pART27 expressing a chimeric polypeptide comprising streptavidin mature peptide fused to the potato proteinase inhibitor-II (PPI-II) signal peptide is targetted to the vacuole.

Transformation of plant genome with the vector can produce pest resistance in plants, plant derived products and stored harvest material. Pests that can be controlled include, cotton bollworm, tropical army-worm, European corn-borer or red mite, tobacco horn worm, loopers, rice stem borer, porina, cutworms, diamondback moth, potato tuber moth, codling moth, Indian meal moth, gypsy moth, argentine stem weevil, clover root weevil, grass-grubs, corn rootworm, rice and wheat weevils, mealworms, flour beetles, black field cricket, locusts, sawflies, Western flower thrips, Hessian flies or two-spotted mite.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of effecting degeneration of a somatic plant tissue by expressing a heterologous protein capable of binding a plant essential factor (PEP), in somatic plant tissue cells, where heterologous protein expression causes depletion of the PEF so the plant viability is maintained, while simultaneous degeneration of the somatic plant tissue is effected. This sequence represents the Streptomyces avidinii sps protein as an example of a heterologous protein introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used to example controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in fruit producing plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Degeneration of somatic plant tissue by expression of a heterologous protein, useful for controlling plant development and morphology, such as decreasing the number of flowers present to increase the number of

This sequence represents the Streptomyces avidinii mst protein as an example of a heterologous protein introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used for artificially controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in fruit producing plants so as to increase the number of fruits which reach maturity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    plant tissue is effected. This sequence represents the Streptomyces avidinii mprost protein as an example of a heterologous protein introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used for artificially controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in fruit producing plants so as to increase the number of fruits which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      plant tissue by expressing a heterologous protein capable of binding a plant essential factor (PEF), in somatic plant tissue cells, where heterologous protein expression causes depletion of the PEF so the plant viability is maintained, while simultaneous degeneration of the somatic

plant tissue by expressing a heterologous protein capable of binding a plant essential factor (PEF), in somatic plant tissue cells, where heterologous protein expression causes depletion of the PEF so the plant viability is maintained, while simultaneous degeneration of the somatic plant tissue is effected. This sequence represents the Streptomyces avidinii prost protein as an example of a heterologous protein introduced into the plants. The methods can provide for the selective and optionally

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The synthetic gene is constructed from 24 oligomers (BB214-BB237) which were synthesised by automated phosphoramidite chemistry. Apart from Met-1, it has the same sequence as natural mature streprotein produced by Streptomyces avidinii.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            reversible cell degeneration in somatic plant tissue. They can be used for artificially controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in fruit producing plants so as to increase the number of fruits which reach maturity.
                                                                                                                                                                                                                                                                                                                                                                                 Recombinant multifunctional protein - having an antibody binding site and a sequence for biological activity, ion sequestering or binding to a solid support.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Biosynthetic Antibody Binding site (BABS); variable domain; anti-CEA monoclonal antibody; streptavidin.

                                                                                                                                                                                The sequence is that of streptavidin from S.avidinii. Streptavidin may be expressed from a fusion gene comprising its coding gene and encoding a target protein of interes, where he streptavidin has binding sites for biotin or deriv. The streptavidin has 4 binding sites free for biotin, and is produced free of biotin contamination. Improved streptavidins may also be produced by site-directed mutagenesis. The fused gene may be used to produce labelled, chemically modified proteins in vivo, and to isolate

                               The present invention describes a fibrinogen-converting enzyme fusion protein (FCE). The fusion protein is a multidomain protein comprising: CC (a) a FCE; and (b) a first member of a binding pair, that is linked to the FCE chain: (i) directly by bonds utilizing the N-terminal amino CC groups, the C-terminal carboxy groups or side-chain functionalities; CC (ii) via a bifunctional linkage molety linking the groups or functionalities; or (iii) by the first member binding to the second CC member of the binding pair, where the second member of the binding pair is covalently attached to the first polypeptide chain. The FCE can be CC used in a method for producing fibrin. Fibrin is useful as a sealant in CC surgery to, e.g. reduce bleeding by sealing blood vessels, and tissues that have been dissected either in surgery or through wounding. The CC fusion protein allows for the removal of the fibrinogen converting CC enzyme from the fibrin sealant preparation via the binding of CC streptavidin to a biotin solid support. The present sequence encodes CC Streptococcus streptavidin as given in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /cgn2_2/gcgdata/geneseq/geneseqn/NA2000.DAT:z52309

plant tissue by expressing a heterologous protein capable of binding a plant essential factor (PEF), in somatic plant tissue cells, where heterologous protein expression causes depletion of the PEF so the plant viability is maintained, while simultaneous degeneration of the somatic plant tissue is effected. This sequence represents the Streptomyces avidinii sps gene as an example of the heterologous gene introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used for artificially controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in fruit producing plants so as to increase the number of fruits which reach maturity.
                                                                                                                                                                                                                                                                                                       The
                                                                                                                                                                                                                                                                                                                                                                                                                    Degeneration of somatic plant tissue by expression of a heterologous protein, useful for controlling plant development and morphology, such as decreasing the number of flowers present to increase the number of

                                                                       This DNA sequence encodes a streptavidin which is used in a novel method CC of reducing interference from non-specific binding in assays. Muteins CC constructed from a core streptavidin or avidin sequence are selected that CC differ from the native polypeptide by at least one amino acid and have a binding affinity for blotin of less than 1010 1/mole. The biotin-bindable CC polypeptide may be present as a polymeric conjugate, e.g. with another CC polypeptide or protein, especially bowlne serum albumin. These muteins CC are used as anti-interference reagents for reducing and/or avoiding CC nonspecific interactions in a process for detecting an analyte. In CC particular, they are used in assays where the streptavidin/avidin-biotin CC specific binding pair is involved for qualitative and/or quantitative CC immunoassay or a hybridisation assay. Despite having a lower binding CC affinity for biotin, the muteins have high immunological cross-reactivity core
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  seq_name: /cgn2_2/gcgdata/geneseq/geneseqn/NA1997.DAT:T73193
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Streptavidin; biotin; anti-interference reagent; detection; mutein; avidin; non-specific binding; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence encodes a wild-type streptavidin protein isolated from Streptomyces avidini. This sequence is used to produce mutants which are used in a method to assay the binding affinity of streptavidin mutants. These mutants have a mutation within the amino acid (aa) region 44-53 of the wild-type protein show a higher binding affinity than the wild-type for peptide ligands that include the sequence of formula Trp-X-His-pro-Gln-phe-Y-Z where X = any aa; Y and Z are both Gly, or Y = Glu and Z = Arg or Lys. Recombinant streptavidin mutants can be used to isolate, purify and determine proteins or to determine/recover substances that contain streptavidin-binding groups. Such compounds may also be used to immobilise fusions on microtitre plates, microbeads or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Streptavidin mutants with higher binding affinity for peptide ligands - have mutation in amino acid region 44-53, used to in purify or determine fusion proteins including these ligands

This is used in the preparation of a recombinant vector, pART27 designed to express a chimeric polypeptide comprising streptavidin mature peptide comprising streptavidin mature peptide. The fused to the potato proteinase inhibitor-II (PPI-II) signal peptide. The binary vector is targetted to the vacuole by PPI-II signal sequence. Transformation of plant genome with the vector can produce pest resistance in plants, plant derived products and stored harvest material. Pests that can be controlled include, cotton bollworm, coursel, plant genome corn-borer or rad miter tobacco horn worm, clopers, rice stem borer, porina, cutworms, diamondback moth, potato tuber moth, codling moth, Indian meal moth, gypsy moth, argentine stem weevil, clover root weevil, grass-grubs, corn rootworm, rice and wheat weevils, mealworms, flour beetles, black field cricket, locusts, sawflies, Western flower thrips, Hessian flies or two-spotted mite.

                                                                                                                                                                                                                                                                                 DNA sequences and hybrid DNA sequences - encoding streptavidin-like polypeptide, also joined to another protein, e.g. tissue plasminogen activator
The inventors claim the DNA sequence in SA307 which codes for a steptavidin-like polypeptide (see N60626), and the polypeptide encoded by it (P60625). They also claim hybrid SQs comprising a not a second sequence coding for another protein, polypeptide, and a second sequence coding for another protein, polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antiblotic; biotin binding affinity; fusion protein;

                                                                                                          plant tissue by expressing a heterologous protein capable of binding a plant essential factor (PEF), in sommatic plant tissue cells, where heterologous protein expression causes depletion of the PEF so the plant viability is maintained, while simultaneous degeneration of the somatic plant tissue is effected. This sequence represents the Streptomyces avidinii mst gene as an example of a heterologous gene introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in sommatic plant tissue. They can be used for artificially controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in fruit producing plants so as to increase the number of fruits which reach maturity.
                                                                                                                                                                                                                                                                                                                                                                                                   The invention

This sequence represents the Streptomyces avidinii mprost gene as an example of a heterologous gene introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used for artificially controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in fruit producing plants so as to increase the number of fruits which reach maturity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of effecting degeneration of a somatic plant tissue by expressing a heterologous protein capable of binding a plant essential factor (PEF), in somatic plant tissue cells, where heterologous protein expression causes depletion of the PEF of the plant viability is maintained, while simultaneous degeneration of the somatic plant tissue is effected. This sequence represents the Streptomyces plant tissue is effected. This sequence represents the Streptomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Degeneration of somatic plant tissue by expression of a heterologous protein, useful for controlling plant development and morphology, such as decreasing the number of flowers present to increase the number of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Examples; Page 86-87; 91pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Streptomyces avidinii.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Plant somatic tissue degeneration; plant essential factor; depletion; viability; mprost gene; plant development; plant morphology; flower;

The invention relates to a method of effecting degeneration of a somatic plant tissue by expressing a heterologous protein capable of binding a plant essential factor (PEF), in somatic plant tissue cells, where heterologous protein expression causes depletion of the PEF so the plant viability is maintained, while simultaneous degeneration of the somatic plant tissue is effected. This sequence represents the Streptomyces avidinii prost gene as an example of a heterologous gene introduced into the plants. The methods can provide for the selective and optionally reversible cell degeneration in somatic plant tissue. They can be used for artificially controlling plant development and morphology. They can be used e.g. to decrease the number of flowers in fruit producing plants so as to increase the number of fruits which reach maturity.
                                                                                                                                                                                                                                                                                                                       Degeneration of somatic plant tissue by expression of a heterologous protein, useful for controlling plant development and morphology, such as decreasing the number of flowers present to increase the number of
                                                                                                                                                                                                                                                                                                                                                                                                    P-PSDB; Y80514.

Other uses of recombinant sbs-A, depending on the nature of the inserted peptide, are as an universal carrier for botinylated reactants for use in immunological or hybridisation assays (the insert is streptavidin, preferably encoded by the present sequence), to induce immune responses (epitopes), as a reagent for removing cytokine or toxin from serum (antigenic epitopes), as a molecular spinning nozzie (polyhydroxybutyrate synthase) and as a molecular laser

                                                                                                                                                                                                                                                                                                                              It is based upon the amino acid sequence of natural mature streptavidin (p93530). It is constructed from 24 oligomers (BB214-BB337) (see Features Table) which were synthesised by automated phosphoramidite chemistry. Complementary oligomers were annealed and the pairs ligated using T4 DNA ligase. The ligated product was sepd. and used to transform HM87. Plasmid DNA was isolated and positive clones selected. It has many restriction sites. Fragments of it are also claimed. The genetic construct is pref. a vector and comprises a chimeric gene composing all of a fragment of it fused to any other DNA sequence to result in a sequence encoding a hybrid protein with biotin-binding activity.
